

CHILDREN'S NUTRITIONAL SUPPORT

Safeguarding our children's health

Nowhere are the adverse effects of the standard American diet more visible than in the current nutritional status of American children. Poor nutritional intake beginning in the womb followed by a diet of highly processed, refined, high fat, high sugar, and low fiber foods has led to a generation of children who are often deficient in essential vitamins, minerals and fatty acids.

Poor nutritional intake beginning in the womb followed by a diet of highly processed, refined, high fat, high sugar, and low fiber foods has led to a generation of children who are often deficient in essential vitamins, minerals and fatty acids.

We always need to remember that children are not just little adults. They are developing human beings. And nutritional deficiencies occurring in the early stages of that development will create long-term health issues later in life. How can we ensure the healthy development of our children?

Docosahexaenoic acid (DHA) is the most abundant essential fatty acid in the brain and is vital for normal, healthy brain structure and function. Studies in children demonstrate that higher DHA levels help to support learning and cognitive function. Poor diet and antibiotics often compromise the existence of healthy, protective bacteria in the gut. Children's Acidophilus is a good option for daily gut support and immune health. Children's Chewable Vitamin with Acidophilus is a definite must for daily nutritional support. And a nutrition-packed breakfast smoothie consisting of whole foods and Perfect Protein Powder will provide children the proper nutrition they need each day to do their best.
